# Parameter estimation

Parameter estimation (PE): get **posterior** of GW parameters  $\theta$

$$p(\theta|d) = \frac{p(d|\theta)p(\theta)}{p(d)} = \frac{\text{likelihood} \times \text{prior}}{\text{evidence}}$$

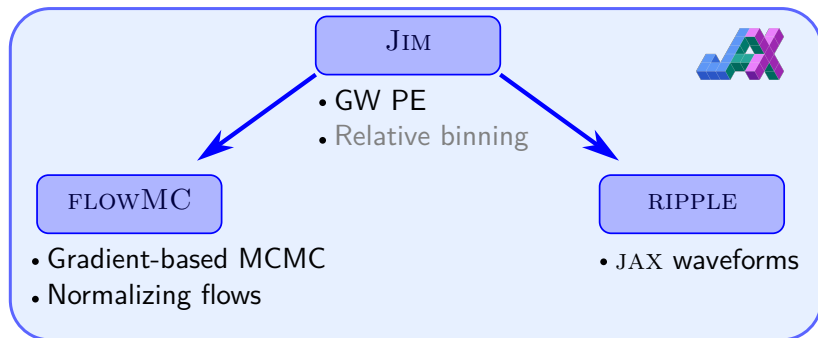

**Problem:** Markov Chain Monte Carlo (MCMC): computationally expensive for binary neutron stars (BNS)

# Overview

JIM: fast parameter estimation of GW signals with JAX

- MCMC sampler: FLOWMC
- Waveforms: RIPPLE

# Table of Contents

① Introduction

② Methods

③ Results

④ Conclusion

# Normalizing flows

- Generative machine learning model
- Learn mapping between **latent** and **parameter** space
- Enable approximate sampling from complicated distributions
- Training data: MCMC samples

FLOWMC: normalizing-flow (NF) enhanced MCMC sampling

- 1 Gradient-based sampler (local sampler)
- 2 Train NF with samples from local sampler
- 3 Sample normalizing flow (global sampler)

# Table of Contents

① Introduction

② Methods

③ Results

④ Conclusion

# Results

- Waveforms: TaylorF2 (TF2), IMRPhenomD\_NRTidalv2 (NRTv2)
- JIM wall time: (i) computing reference parameters for relative binning, (ii) training NF, (iii) sampling

Event	Waveform	JIM (1 GPU)	pBILBY (480 cores)	RB-BILBY (24 cores)	ROQ-BILBY (24 cores)
GW170817	TF2	(9.70 + 17.00) min	9.64 h	3.18 h	–
	NRTv2	(5.69 + 28.02) min	10.99 h	4.68 h	1.65 h
GW190425	TF2	(5.13 + 16.49) min	4.08 h	2.30 h	–
	NRTv2	(6.15 + 15.37) min	4.69 h	4.68 h	0.97 h
Injection	TF2	24.76 min	–	–	–
	NRTv2	18.02 min	–	–	–

(pBILBY = PARALLEL BILBY, RB = relative binning, ROQ = reduced order quadrature)

# Environmental impact

JIM is **more environmentally friendly** than existing pipelines

- Energy consumption for all 204 runs of paper
- Convert to number of trees to capture the emitted CO<sub>2</sub> in a year.

Method	Trees
JIM	0.55
pBILBY	59.02
RB-BILBY	1.49
ROQ-BILBY	sampling 0.52
	precompute <sup>†</sup> 0.44

<sup>†</sup>Estimated cost to build ROQ bases.

① Introduction

② Methods

③ Results

④ Conclusion

# Conclusion

JIM: a fast and environmentally friendly PE pipeline for GW signals. Our contribution:

- TaylorF2 and IMRPhenomD\_NRTidalv2 in RIPPLE
- Parameter estimation of BNS in 15 – 30 minutes sampling time without pretraining

Applications:

- Low-latency
- Future GW detectors, e.g. Einstein Telescope
- Multi-messenger astrophysics: e.g. NMMA [1]

## **APPENDIX**

# Normalizing flow details

- Rational-quadratic neural spline flows
- 10 layers, 8 bins
- 128 neurons in hidden layers
- Adam optimizer, learning rate decayed (polynomial schedule)
- Deep learning library: EQUINOX

Loss function: KL divergence on sampled data

$$\mathcal{L}(T) = -\frac{1}{n} \sum_{i=1}^n \log \hat{\rho}(x_i)$$

# Stopping criterion

We stop training the NF if we achieve a mean Metropolis-Hastings acceptance rate of 10% (20%) for real events (injections).

Example: GW170817, TaylorF2 with 20%:

# Validation – Mismatch waveforms

Cross-check against LALSUITE: mismatch histogram based on 10 000 waveforms, from uniform samples with following ranges:

Parameter	Range
Component masses	$[0.5M_{\odot}, 3M_{\odot}]$
Component aligned spins	$[-0.05, 0.05]$
Dimensionless tidal deformabilities	$[0, 5000]$
Inclination angle	$[0, \pi]$

# Validation – p-p plot

We demonstrate the robustness of JIM:

- 100 GW events with HLV at design sensitivity and  $T = 128$  s,
- NRTv2: reference waveform relative binning without taper,
- Priors: Table 1.

*Table 1:* Prior ranges used in our analyses. All priors are uniform priors with the specified range.

Parameter	Injection	GW170817	GW190425
$\mathcal{M} [M_{\odot}]$	[0.88, 2.61]	[1.18, 1.21]	[1.485, 1.490]
$q$	[0.5, 1]	[0.125, 1]	[0.125, 1]
$\chi_i$	$[-0.05, 0.05]$	$[-0.05, 0.05]$	$[-0.05, 0.05]$
$\Lambda_i$	[0, 5000]	[0, 5000]	[0, 5000]
$d_L$ [Mpc]	[30, 300]	[1, 75]	[1, 500]
$t_c$ [s]	$[-0.1, 0.1]$	$[-0.1, 0.1]$	$[-0.1, 0.1]$
$\phi_c$	$[0, 2\pi]$	$[0, 2\pi]$	$[0, 2\pi]$
$\cos \iota$	$[-1, 1]$	$[-1, 1]$	$[-1, 1]$
$\psi$	$[0, \pi]$	$[0, \pi]$	$[0, \pi]$
$\alpha$	$[0, 2\pi]$	$[0, 2\pi]$	$[0, 2\pi]$
$\sin \delta$	$[-1, 1]$	$[-1, 1]$	$[-1, 1]$

# GW170817 & GW190425: Jensen-Shannon divergences

*Table 2:* Jensen-Shannon divergences (in bits) between the marginal posterior obtained for GW170817 and GW190425 using TaylorF2 and IMRPhenomD\_NRTidalv2 with JIM and PBILBY, with the highest value of each comparison in bold. The divergences are bound between  $[0, 1]$ .
